

Anchiano Is Live

Anchiano is a small desktop cipher tool for encrypted message content. It does not provide anonymity, and that boundary is stated clearly.

HTTPS://HEDEGREENRESEARCH.COM/ARTICLES/ANCHIANO-IS-LIVE/

Anchiano went live on April 15, 2026.

It gives a simple first layer for encrypted contact.

If you send text through Anchiano with a shared key, the message content is protected.

That is the point of the release.

It is also important to state what it is not:

Anchiano is not an anonymity tool.

It protects message content, not sender identity.

If you send from an account tied to your name, that identity is still attached to the act of sending.

So this is first-layer infrastructure.

Not the whole operational model.

The tool is small by design: text in, key in, encrypted output out.

No account. No server dependency in the local encrypt/decrypt flow.

If you need to send something sensitive to Hedegreen Research, this is now a concrete option.

Use it with clear boundaries.

And use a separate trusted channel when agreeing on keys.
